This Report is brought to you for free and open access by the Public Health 100: Global Public Health Brief at Augustana Digital Commons. It has been accepted for inclusion in Global Public Health by an authorized administrator of Augustana Digital Commons. For more information, please contact digitalcommons@augustana.edu.
Vietnam

Population ≈ 95,700,000 people (WHO, 2017).
Ethnic Makeup: Kinh (Viet) 85.7%, Tay 1.9%, Thai 1.8%, Muong 1.5%, Khmer 1.5%, Mong 1.2%, Nung 1.1%, Hoa 1%, other 4.3% (Central Intelligence Agency, 2017).

Political Structure

- Vietnam is a socialist country under the leadership of the Vietnam Communist Party (Vietnam Embassy-USA, 2017).
- The National Assembly, which includes 498 members, has constitutional and legislative power and elects the President of the State and Prime Minister (Vietnam Embassy-USA, 2017).

Major Challenges

1. Internal Challenges
   - Large gap in the health status between regions of the country and between different populations (WHO, 2017). This results in varying prevalence of dengue fever and treatment available.
   - Unrelated to dengue fever, Vietnam also struggles with determining the amount of government involvement in the economy and sustaining a multilateral foreign policy (Vu, 2015).

2. External Challenges
   - In 2014, China’s Haiyang Shiyou 981 drilling platform placed an oil rig in territorial waters (Ives, 2016).
   - This sparked other investigations involving unannounced, state-sponsored Chinese flights through Vietnamese-administered airspace and destruction of a shipping vessels (Ives, 2016).

Dengue Fever in Vietnam

- Dengue fever is a mosquito-borne viral disease which is a leading cause of illness and death in tropical and subtropical countries (Lee, Nguyen-Viet, Nam, Lee, Won, Duc, & Grace, 2017).
- Dengue fever is becoming a public health problem—especially in Vietnam—due to climate changes (temperature, precipitation, humidity) significant impact on vector populations (Lee et al., 2017).
- Vietnam has the highest number of dengue fever cases in the Western Pacific region (Lee et al., 2017).
- In 2016, there were approximately 110,000 cases of dengue fever and 40 deaths reported (Herriman, 2017).
- The cost of this treatment for 2015 totaled approximately 37,700 USD per patient (Vo, Phan, & Vo, 2017).

Epidemiology

- Frequency:
  - Increased incidence rates were observed in the second half of each year—from May to December (Lee et al., 2017).
  - Sudden peaks in each province were assumed to be related to emergence of stereotypes or drop in herd immunity (Lee et al., 2017).
- Most affected groups:
  - Peri-urban/rural areas → poorly sanitized living conditions (Lee et al., 2017).
- Risk factors:
  - Not receiving adequate treatment in a timely manner (Vo et al., 2017).
  - Lack of reliable water supply (Lee et al., 2017).
○ Stagnant water and substandard sanitary and hygiene practices → breeding ground for vectors (Lee et al., 2017).

Identification

● Dengue-related signs include flu-like symptoms, a severe headache, and joint and muscle soreness (Vo et al., 2017).
● To diagnose patients, doctors use a blood test to check for the virus or antibodies associated with dengue fever (WebMD).

Intervention

● Vietnam developed a National Dengue Control Programme (NDCCP) in 1999 to pilot several models for community-based vector control (WHO, 2017):
  ○ Use of Mesocyclops in water containers to eat larvae (WHO, 2017).
  ○ Provide guppy fish to school children who then place the guppies in water containers at home to eat larvae (WHO, 2017).

Challenges

● Lack of quality public health insurance available to cover the cost of diagnosis and treatment (Vo et al., 2017).
● The lower income communities are the most affected population but they are also the ones who cannot afford the high cost of treatment (Vo et al., 2017).
● The climate change is inducing prime breeding grounds for the vectors (Lee et al., 2017).
● The symptoms can sometimes be mistaken for the flu (Vo et al., 2017).

Suggestions

● Educate the low income communities about the threat of dengue fever and how to avoid the vectors (don’t leave water outside, practice sanitation, etc.).
● Increase access to clean and safe water sources in lower income areas.
● Push for public aid to cover the cost of dengue fever treatment.
● Encourage doctors to test for dengue fever if the patient is presenting severe flu-like symptoms and not improving.
